Variants shared across samples

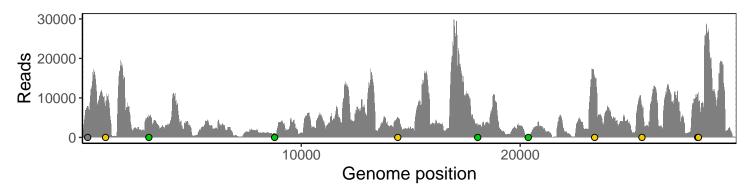

The heat map below shows how variants are shared across subject samples. The quality scores are PHRED scaled values $[Q = -10\log 10(error\ rate)]$ where a score of 30 represents a probabilty of 99.9% that a variant is called correctly and a score of 50 represents a probabilty of 99.999% Gray tiles denote that 10 or more reads covered the variant position and the reference base was observed. Tiles are ommitted if there are less than 10 reads covering a variant position.
